                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tyrosine phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.

LALTERNATIVE PRODUCTS: 2 ISOFORMS; CAK I (SHOWN ARE PRODUCED BY ALTERNATIVE SPLICING. THEY ONLY ABSENCE OF A 37 RESIDUES SEGMENT.

TISSUE SPECIFICITY: THE PREDOMINANT ISOFORM CAK DEVELOPING EMBRYO AND ADULT BRAIN; CAK II IS EXECUTED IN CELLS.

SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the cellular compartment.";

J. Cell Biol. 109:3493-3501(1989).

-i. FUNCTION: THE EXTRACELLULAR MATRIX (ECM) OF VOLVOX CONTAINS INSOLUBLE FIBROUS LAYERS THAT SURROUND INDIVIDUAL CELLS AT A DISTANCE TO FORM CONTIGUOUS CELLULAR COMPARTMENTS. SSG 185 IS MONOMERIC PRECURSOR OF THIS SUBSTRUCTURE (C3Z STRUCTURE), THE COVALENT CROSS-LINKS ARE FORMED BETWEEN THE SACCHARIDE CHAINS RATHER THAN BETWEEN THE POLYPEPTIDE CHAINS.

-i. PTM: A CENTRAL DOMAIN OF 77 AA CONSISTS ALMOST EXCLUSIVELY OF HYDROXYPROLINE RESIDUES.

-!- FUNCTION: BINDS TO THE FC REGION OF MONOMERIC IMMUNOGLOBULINS GAMMA. MEDIATES THE SELECTIVE UPFAKE OF IGF FROM MILK AND HELPS NEWBORN ANIMALS TO ACQUIRE PASSIVE IMMUNITY. IGG IN THE MILK IS BOUND AT THE APICAL SURFACE OF THE INTESTINAL EPITHELIUM. THE RESULTANT FCRN-IGG COMPLEXES ARE TRANSCYTOSED ACROSS THE INTESTINAL EPITHELIUM AND IGG IS RELEASED FROM FCRN INTO BLOOD COMPLEXES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS).

The polypeptide is capable of binding the flt3 receptor and is: a) amino acids 28-x of murine flt3 ligand (flt3-L), where x is an amino acid between 163-231; b) amino acids 28-y of human flt3-L, where y is an amino acid between 160-235; and c) a polypeptide that has at least 90% identity to the polypeptides of either (a) or (b). The method ameliorates the effects of autoimmune diseases, food allergies or organ or tissue rejection following transplantation. Administration of flt3-L allows lower doses of antigens to be used in vivo for mucosally administered antigens. The present
                                                                                                                                                                                                            myelodysplasia; aplastic anemia;
multiple myeloma; leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method has been developed of initiating or enhancing: (i) an antigen-
specific immune tolerance; or (ii) immunotolerance of a therapeutic
immunogenic molecule by addition of a polypeptide, before, after or with
the mucosal administration of an immunotolerising amount of the antigen
                                                                                                                                                       Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Full length wild type human flt-3 protein.

                                                                                                                                                         suppressing tumour growth in a mammal. The tumour is melanoma, glioma or lymphoma, particularly B-cell mynhoma. They can also be used for the prophylactic and/or therapeutic treatment of:

(a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis B and C in humans), parasitic (e.g. malaria) and fungal infections;
                                                                                                                                                                                                                                                         polynucleotide may encode the present full-length human Fit-3 ligand polypeptide, or amino acids 27-160, 1-160, 27-185, 1-185, or 27-235 of the ligand. The polynucleotides are incorporated into the cells of the vertebrate in vivo, and a prophylactically or therapeutically effective amount of Fit-3 ligand and 1 or more antigens or cytokines is produced in vivo. Pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                     (Fit-3 ligand). The invention is directed to enhancing the immune response of a vertebrate to an antigen or a cytokine by administering in vivo, into a tissue of a vertebrate, a Fit-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunogenic compositions comprising Flt-3 ligand encoding polynucleotide and one or more antigen, or cytokine encoding polynucleotides, useful for suppressing tumour growth and for treating

                                                                                                                                                                                                                                                                     CC involves administering a combination of two to five agents. The method CC agent; (c) dendritic cell mobilisation factor; (b) dendritic cell mobilisation factor; (b) dendritic cell maturation CC agent; (c) dendritic cell activation agent; (d) T cell enhancing factor; CC or (e) activated, antigen-specific T cells. The methods are useful for CC treating an individual at risk for or suffering from infection with a CC pathogenic or opportunistic organism, e.g. viruses (e.g. HIV), bacteria CC (e.g. M. tuberculosis), yeast, fungi (e.g. C. albicans) or protozoa (e.g. CC T. cruzi, which causes Chaga's disease). The methods are especially CC useful for treating an individual suffering from immunosuppression by CC enhancing a lymphocyte-mediated immune response. In particular, the CC method is useful for treating inflammations, chickenpox, oral or genital CC trepes, mononucleosis, multifocal leukoencephalopathy, hepatitis, AIDS, CT cell leukemia or T cell lymphoma. The activated antigen-presenting CC dendritic cells are useful as a vaccine adjuvant. The present sequence CC represents a human Flt3L polypeptide fragment, that can be used as a CC dendritic cell mobilisation factor.

RESULT 6
AAR66175
ID AAR6
C MRIBS, was screened with an 800 bp fragment derived from pMRIBS, was screened with an 800 bp fragment derived from conserved between two mouse clones, TilB and TilO. Approx. 20 conserved between two mouse clones, TilB and TilO. Approx. 20 conserved between two mouse clones, TilB and TilO. Approx. 20 cones, S86 and S109, were found to be approx. 75% homologous to the mouse clones over the first 163 AAs. Clone S86 continued to be approx. 75% homologous to the mouse clones over the first 163 AAs. Clones S10 continued to be approx. 75% homologous to show homology to TilO until the stop codon, although to a lesser degree, for an overall homology of 66%. Clones TilB and S109 do not show homology to each other or to the other clones after mouse residue 163 (human residue 160). An additiona mouse clone designated MBB has a 29 AA insert at the junction between the common and divergent portions of the mouse ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19-MAY-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       compositions comprising the polynucleotides are useful for suppressing tumour growth in a mammal. The tumour is melanoma, glioma or lymphoma, particularly B-cell lymphoma. They can also be used for the prophylactic and/or therapeutic treatment of: (a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis and C in humans), parasitic (e.g. malaria) and fungal infections (b) autoimmune diseases (e.g. rheumatoid arthritis and osteoarthritis); (c) cancer; and (d) Aujeszky's disease in pigs. Various other examples of these diseases are given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY69721 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of the fit 3 ligand. The polynucleotides are incorporated into the cells of the vertebrate in vivo, and a prophylactically or therapeutically effective amount of Fit 3 ligand and I or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immune response of a vertebrate to an antigen or a cytokine by administering in vivo, into a tissue of a vertebrate, a Flt-3 ligand-encoding polynucleotide, and 1 or more antigen- or cytokine-encoding polynucleotides. The Flt-3 ligand-encoding polynucleotide may encode the present full-length human Flt-3 ligand polypeptide, or amino acids 27-185, 1-185, 27-235 or 1-235 for 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              specification.

The protein can also modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or immunosuppression). The protein may be used to treat a pathological condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, small cell lung, testicular or ovarian cancer, lymphoma, multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the full length wild type (AAY69719) or mature (AAY69720) flt3-L polypeptides. This sequence represents an example of the novel flt-3 ligands and comprises the L-3H mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoletic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or dendritic differentiation, e.g. in hematopoletic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutant soluble flt3 ligand polypeptide used in cellular expansion, immune response stimulation or treatment of pathological conditions contains amino acid substitutions at positions 8, 84, 118 or 122 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAY69719) or mature (AAY69720) flt3-L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Graddis TJ,

This sequence represents a rearranged human flt-3 receptor agonists of CC the invention. The agonists have a modified flt-3 ligand amino acid CC sequence. The agonists are used to stimulate production of haematopoietic CC cells in vivo (e.g. in a subject about to donate blood) or for ex vivo CC expansion for subsequent transplantation, e.g. to reconstitute bone CC marrow after chemotherapy, disease etc., or to treat haematological CC disease such as drug-induced myelosuppression, defects caused by CC infections, burns or renal dialysis. Optionally ex vivo expanded cells CC are transduced with a gene therapy vector for treating e.g. congenital CC metabolic diseases, immune deficiency, neurological disease, cancer and CC infections. The agonists can also be used in the treatment of tumours, CC infections and autoimmune disease, when administered optionally with an CC antigen. The agonist can also be used in the production of dendritic CC cells for use as an immunising adjuvant for treatment disorders including acquired immune deficiency syndrome. Compared with native ligands, the CC may agonists have better stimulatory activity, reduced side effects CC and/or better physical properties such as solubility, stability or refold CC efficiency. When used together with other stimulatory agents, the

Mature wild type human flt-3 protein

```
The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAX69719) or mature (this sequence) flt3-L colypeptides. The flt3-L protein binds cell surface tyrosine kinase creeptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein can be used to induce cellular cells expansion (especially in vivo) or differentiation, e.g. in chematopoietic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins, colony stimulating cellscrors or protein kinases. The protein can also modulate, sugment or cenhance a patient's immune response and can be used to treat an immune cellscropy, autolumunity or immunosuppression). The protein can also modulate, sugment or constant canemia, HIV infection, breast, small cell lung, testicular or lankemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                       be used to induce cellular expansion (especially in vivo) or differentiation, e.g. in hematopoletic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins, colony stimulating factors or protein kinases. The protein can also modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or immunosuppression). The protein may be used to treat a pathological condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, small cell ling, testicular or ovarian cancer, lymphoma, multiple
                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                        polypeptides. This sequence represents an example of the novel flt-3 ligands and comprises the K84E mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein can
                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAY69719) or mature (AAY69720) flt3-L
                                                                                                                                                                                                                  myeloma, neuroblastoma or acute leukemia

                                                                                                                                                                                                                                                                                                                                                                                     polypeptides. This sequence represents an example of the novel flt-3 ligands and comprises the Q122R mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or differentiation, e.g. in hematopoietic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAX69719) or mature (AAX69720) flt3-L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Graddis TJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ωy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                        polypeptides. This sequence represents an example of the novel flt-3 ligands and comprises the L26F mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or differentiation, e.g. in hematopoietic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins, colony stimulating factors or protein kinases. The protein can also
                                                                                                                                                                                                                                                                                                               Mutant soluble flt3 ligand polypeptide used in cellular expansion, immune response stimulation or treatment of pathological condition contains amino acid substitutions at positions 8, 84, 118 or 122 \,
                                                                                                                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                             The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAY69719) or mature (AAY69720) flt3-L
                                                                                                                                                                                                                                                                              Claim 13; Page 82-83;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer; dendritic cell; immune response; autoimmunity; immunosuppression;

The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAX69719) or mature (AAX69720) flt3-L polypeptides. This sequence represents an example of the novel flt-3 ligands and comprises the L26F mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein car

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel soluble flt3 ligand (flt3-L) polypoptides cc which exhibits increased or decreased biological activity relative to cc the full length wild type (AAX69719) or mature (AAX69720) flt3-L cc polypoptides. This sequence represents an example of the novel flt-3 cc ligands and comprises the H8Y mutant polypoptide. The flt3-L protein cc binds cell surface tyrosine kinase receptors and regulate growth and cc differentiation of hematopoietic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or cc differentiation, e.g. in hematopoietic, natural killer (NK) or dendritic cc lls, especially in the presence of growth factors such as interleukins, cc colony stimulating factors or protein kinases. The protein can also cc modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, cm myeloma, neuroblastoma or acute leukemia.
                                                                                                                                                                                       δõ
                                                                                                                                                                                                                                                                Qy
